

Legacy Application Migration

Native Gateway©

***Upgrade Legacy Norand Native & LXE LDS Wireless Systems Seamlessly
"Without Any Application Changes"***

No Application Coding

Native Gateway is a Plug and Play Solution that replaces your current Norand or LXE RF controller. Available in both a hardware and software versions, it translates commands sent by your application into industry standard VT terminal commands. Just unplug your current controller and plug in the NATIVE GATEWAY controller. The Advanced version supports table commands as well as basic WtD commands.

No Retraining

Move your users to the current leading-edge hardware without costly retraining on new software. Even the keys work just like they do on your current system.

Open Architecture

Use any manufacturer's RF terminals that support VT100/220 emulation. If your current hardware has been desupported, move to new hardware with no software porting costs. Move from legacy UHF & 900MHz to 2.4 GHz and beyond. Take advantage of the new 802.11 Open Systems radio technology!

Perfect Migration Path

Native Gateway allows you to continue running your old native applications while porting them to a Terminal Emulation environment. Alternatively, keep those old applications while developing new TE apps to run on the same terminals. Leverage your investment in RF hardware without dumping more money in those old native applications.

Easy Installation

Native Gateway is a complete solution. Easy installation procedure gets you going in no time. Test everything out from your desktop just by using telnet to connect to your native application.

Proven Solution

Tacit's Native Gateway has an impressive install base supporting thousands of terminals. Leverage this proven solution to lower your cost of ownership and migrate to wireless Open Systems.
